Lista 1 de estatística computacional

Exercício 1:

$P(A): (6,3), (5,4), (4,5), (3,6), (6,4), (5,5), (6,5), (5,6), (6,6)$
 $P(A) = \frac{\text{nº eventos possíveis}}{\text{nº eventos totais}} = \frac{9}{36} = \frac{1}{4} = 25\%$

$P(B): (1,2), (2,1), (2,3), (3,2), (4,3), (3,4), (5,4), (4,5), (5,6), (6,5)$
 $P(B) = \frac{10}{36} = \frac{5}{18} = 0,27 = 27\%$

$P(C): \frac{1}{6} + \frac{1}{6} = \frac{2}{6} = \frac{1}{3} = 0,33 = 33\%$

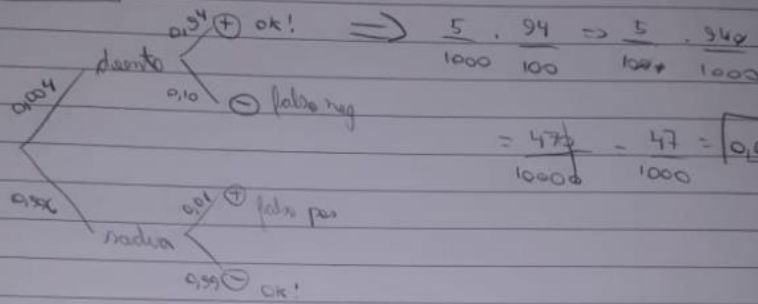

$P(D): (4,5), (5,4), (5,5), (6,5), (5,6), (6,6) = \frac{1}{6} = 16,6\%$

$P(B|C) = \frac{P(B \cap C)}{P(C)} = \frac{5}{18} \cdot \frac{6}{18} = \frac{5}{54} = 9,2\%$

$P(A \cap D) = \frac{1}{4} \cdot \frac{1}{6} = \frac{1}{24}$

$P(C \cup D) = \frac{6}{24} + \frac{4}{24} = \frac{10}{24} = \frac{5}{12}$

Exercício 2

a) probabilidade de 4,7%.

Exercício 3

Venda I: 6 pretos, 3 brancos, 5 normais $\Rightarrow \frac{1 \cdot 5}{6 \cdot 14} = \frac{5}{84}$

Venda II: 4 pretos, 4 brancos, 2 normais $\Rightarrow \frac{1 \cdot 2}{3 \cdot 10} = \frac{1}{15}$

Venda III: 4 pretos, 2 brancos, 7 normais $\Rightarrow \frac{1 \cdot 7}{2 \cdot 13} = \frac{7}{26}$

a) $\frac{5}{84} + \frac{1}{15} + \frac{7}{26} = \frac{35 + 34 + 1170}{5460} = \frac{1239}{5460} = \frac{1}{4,4}$

b) a probabilidade de 1 de 4,4 = $\frac{1}{4,4} = \frac{1}{4,4}$

EXERCÍCIO 4

D $(D, R, N, J), (R, J, N, D), (J, N, R, D), (D, N, R, J)$
 R $\Rightarrow (J, R, D, N), (R, J, D, N), (J, R, D, N), (R, N, D, J)$
 N (D, J, R, N)
 J

$$24 - 9 = 15$$

Total de cores: $4! = 24$

$$P = \frac{15}{24} = \frac{5}{8}$$

EXERCÍCIO 5

cora \rightarrow 1 esquerda
 ra \rightarrow 1 direita

1) Concordo. Pois da posição que ele está, não necessariamente 2 jogadas cora o vão saltar, e se ele tirar alguma cora, não necessariamente mais um lançamento para ele saltar. Portanto apenas com números pares de jogadas.

$$\text{probabilidade é de } \frac{6}{24} = \frac{1}{4} = 25\%$$

EXERCÍCIO 6

$$P(X=1) = \frac{2}{8}$$

$$P(X=3) = \frac{2}{8}$$

$$P(X=5) = \frac{4}{8}$$

$$a) P(X \leq 4) : P(3) + P(1) = \frac{4}{8} = \boxed{\frac{1}{2}}$$

$$b) P(X \geq 4) : P(5) = \boxed{\frac{1}{2}}$$

EXERCÍCIO 7

$$a) X \text{ assume } 2, 3, 4, 5, 6$$

$$b) P(X=k), \quad X \geq 2 \text{ e } X \leq 6$$
$$k = n+1.$$

$$c) P(X \leq 3) = \frac{1}{5} = \boxed{20\%}$$

$$P(X \geq 3) = \frac{3}{5} = 0,6 = \boxed{60\%}$$

$$d) P(X > 2) = \frac{4}{5} + \frac{3}{5} = \boxed{\frac{12}{25}}$$

Exercício 8

a) $P(x \in A) = x \sim f$

$$P(x \in A) = \int_{-\infty}^{\infty} f(x) dx = \int_{-2}^0 f(x) dx + \int_0^2 f(x) dx = 0 + 3 = 3$$

b) $f(x \in A) = x \sim f$

$$P(x \in A) = \int f(x) dx$$

$$\int_{-\infty}^{\infty} f(x) dx = \int_{-5}^0 f(x) dx + \int_0^2 f(x) dx = 0 + 2 = 2$$

d) $P(x \in A) = 0,4$

$$n = 1,28$$

Exercício 9

$$b) \int_{-\infty}^{+\infty} f(x) dx = \int_{-\infty}^{-3} f(x) dx + \int_{-3}^{10} f(x) dx + \int_{10}^{15} f(x) dx + \int_{15}^{+\infty} f(x) dx$$

$$= \frac{1}{4} + \frac{3}{4} = ①$$

$$c) \int_8^{10} \frac{1}{40} (x-4) + \int_{10}^{12} \frac{3}{20} = \boxed{\frac{11}{20}}$$

$$d) \int_8^{10} \frac{1}{40} (x-4) + \int_{10}^{12} \frac{3}{20} = \frac{11}{50} + \frac{3}{10} = \boxed{\frac{9}{10}}$$
